### Abstract

The list of subfamily Catocalinae (Lepidoptera; Noctuidae) of Iran is updated. Until now, 111 species belonging to 22 genera of this subfamily are recorded. Also, the Iranian records in different provinces are presented.

**Key words:** *Anumeta*, Catocalinae, *Catocala*, *Clytie*, *Drasteria*, Iran

### Introduction

Iran is the 18th-largest country in the world in terms of area at 1,648,195 km<sup>2</sup> (636,372 sq mi). It is a mountainous country of particular geopolitical significance owing to its location in three spheres of Asia. Iran's climate ranges from arid or semiarid, to subtropical along the Caspian coast and the northern forests. On the northern edge of the country (the Caspian coastal plain) temperatures rarely fall below freezing and the area remains humid for the rest of the year. The populous western part is the most mountainous, with ranges such as the Zagros and Alborz Mountains; the last contains Iran's highest point. The northern part of Iran is covered by dense rain forests called Shomal or the Jungles of Iran. The eastern part consists mostly of desert basins such as the Dasht-e Kavir, Iran's largest desert, in the north-central portion of the country, and the Dasht-e Lut, in the east, as well as some salt lakes. This is because the mountain ranges are too high for rain clouds to reach these regions. Iran's faunal diversity is comparatively high due to the country's varied geological, altitudinal and climatic structure; therefore it would be expected that there is a rich Lepidoptera fauna in this country. In the present paper the list of the species and subspecies of subfamily Catocalinae in Iran is provided. Totally, 111 species and subspecies belong to 22 genera are listed. In addition, new distributional data for some species are presented here (Table 1).

### Martial and Method

Adult specimens were collected using mobile light trap systems (powered by 12 volt batteries and 8 watt Black light UVB tubes) from Iran. Genitalia of both sexes were dissected, stained, and mounted following Fibiger (1997). Prepared genitalia slides were examined using binocular stereomicroscope (Olympus

SZ60). Photographs of adult specimens and genitalia were taken by a Canon Power Shot A3000 Digital Camera, using a stereomicroscope eyepiece for the genitalia. Arc GIS 9.2 software was used to make the geographical map of the Iran (Fig. 1).

## Result and Discussion

Totally, 111 species and subspecies belong to 22 genera of Subfamily Catocalinae from Iran are listed. Among these genera, Catocala, Authophila, Drasteria include 49 percent of all genera in this subfamily.
